Abstract

5

In order to be able to reuse the lancets (5) that are  
stored in a lancet storage container (6) and used in a  
blood withdrawal system for taking a blood sample for  
10 analytical and diagnostic purposes, and in order to  
reduce the time period elapsing until the puncturing  
motion is performed, it is proposed to provide a lancet  
tip protective element (13) in a parking position of the  
lancets (5) by means of which the lancet tip is protected  
15 mechanically and hygienically.
